

Wavelab 6 - Crystal Resampler

The Crystal Resampler plug-in (only available in the Master Section) is a professional sample rate converter providing exceptional transparency and preservation of the frequency content.

The sample rate can be set from 6- 384 kHz. This parameter defines the output sample rate while the input sample rate is determined by the sample rate of the active audio file or Audio Montage.

The Quality parameter defines the quality of the algorithm which is used. In Preview mode the CPU load is much lower than in Ultra mode but as the trade off the sonic quality of the resulting audio is also lower. The settings you can select from are: Preview (fast), Standard, High, and Ultra (slow).
